

System Manual

There is a two tier deployment process for this application which is explained below:

Backend deployment

1. Run the WCF service to create bin and svc files
2. Create a IIS application to hold the service
3. Publish the service the desired IIS deployment location
4. Assign the IP address to the service
5. Change the application pool of the service to dotnet 4.5.
6. Run the application to host the service online

Frontend deployment

1. Change the base url in config file to the above hosted service base url.
2. Create facebook app id to get user info data.
3. Run the build and generate a apk and ipa file which will run on device.
